1. SUMMARIZE

TS Series helical-worm gearmotor is a new generation mechanic-electrical integrated product, which designed basing on the modular system. It can be connected respectively with motors such as common motor, brake motor, explosion-proof motor, frequency conversion motor, servo motor, IEC motor and so on. It can be mounted discretionary six orientation in solid space. This kind of product is widely used in drive fields such as textile, foodstuff, beverage, chemical industry, automatic arm ladder, automatic storage equipment, metallurgy, tobacco, environment-protection, logistics and so on.

1.1 PERFORMANCE CHARACTERISTICS

1. Transmission ratio with fine stage covers a wide range;
2. Compact structure takes up small room;
3. low vibration; low noise; low energy dissipation;
4. Deft design; reliable and wearable; wide usage;
5. Modular, multistructure, can be combined in many forms to meet needs of all kinds of transmission conditions.

TS Series helical-worm gearmotor is formde of helical-wrom gears unit and motor. The helical gear and worm use high quality alloy steel with surface hardening;the worm wheel adopts wearable tin bronze which shoped by high precision device. All housing are in cast iron. offer precision finishing to ersure the shape and position precision,and it reaches advantageous performance such as: strong bearing capacity, long service-life; small volume; big ratio; light, high efficiency, low noise.

TS Series helical-worm gearmotor has seven models. Combined with TRF series, the multi-stage gear reduction can be achieved. Power 0.12-22KW; Ratio 6.80-33818;Torque 92-4000Nm. It can connect (foot, flange) discretionary and use multi-mounting positions according to customers' requirements.

4. RELEVANT PARAMETER

4.1 Power P

$$P_1 = \frac{P_2}{\eta} \text{ [kW]}$$

$$P_{1n} \geq P_1 \cdot f_s \text{ [kW]}$$

P_1	Input power
P_2	Output power
P_{1n}	Rated power driving motor
f_s	Service factor
η	Transmission efficiency

Values of η are calculated for gearboxes after a sufficiently long running-in period. After the running-in period the surface temperature in operation reduces and finally stabilises. It may be worth highlighting that values of rated torque M_{2n} given in the transmission efficiency η into consideration.

4.2 Rotation speed

n_1	Gear units input speed
n_2	Gear units output speed

If driven by the external gearing, 1400r/min or lower rotation speed is suggested so as to optimize the working conditions and prolong the service life. Higher input rotation speed is permitted, but in this situation, the rated torque M_2 will be reduced.

4.3 Transmission ratio i

$$i = \frac{n_1}{n_2}$$

Usually transmission ratio is decimal fraction with 2 radix point tagged in selection tables.

4.4 Torque M

$$M_2 = \frac{9550 \cdot P_1 \cdot \eta}{n_2} \text{ [Nm]}$$

$$M_{2n} \geq M_2 \cdot f_s \text{ [Nm]}$$

M_2	Output torque
M_{2n}	Selected output torque
P_1	Input power
η	Transmission efficiency
f_s	Service factor

4.5 Service factor f_s

The effect of the driven machine on the gear unit is taken into account to a sufficient level of accuracy using the service factor f_s . The service factor is determined according to the daily operating time and the starting frequency Z . Three load classifications are considered depending on the mass acceleration factor. You can read off the service factor applicable to your application in following Figure. The service factor selected using this diagram must be less than or equal to the service factor as given in the performance parameter table.

starting frequency Z : The cycles include all starting and braking procedures as well as change overs from low to high speed.

4.5.1 load classifications

- (A) Uniform, permitted mass acceleration factor $f_a \leq 0.2$
- (B) Moderate shock load, permitted mass acceleration factor $f_a \leq 3$
- (C) Heavy shock load, permitted mass acceleration factor $f_a \leq 10$

Load classifications see the addendum

4.5.2 Mass acceleration factor

The mass acceleration factor is calculated as follows:

$$f_a = \frac{J_c}{J_m}$$

f_a Mass acceleration factor

J_c All external mass moments of inertia (kgm^2)

J_m Mass moment of inertia on the motor end (kgm^2)

If mass acceleration factors $f_a > 10$, please call our Technical Service.

Service factor f_s should be adjusted as following :

- 1). ambient temperature is $30 \sim 40^\circ\text{C}$: f_{sx} (1.1~1.2)
- 2). ambient temperature is $40 \sim 50^\circ\text{C}$: f_{sx} (1.1~1.2)
- 3). ambient temperature is $50 \sim 55^\circ\text{C}$: f_{sx} (1.1~1.2)
- 4). ambient temperature $> 60^\circ\text{C}$: Please call our Technical Service.

RELEVANT PARAMETER

To keep the service-life of gear units, the use factor f_s selected from the catalogue must be equal or slightly higher than the calculated use factor f_s

4.6 Radial loads F_r

When determining the resulting radial loads, the type of transmission elements, mounted on the shaft end must be considered. Various transmission elements are corresponding with following transmission element factors f_z :

Transmission element	Transmission element factor f_z	Comments
Gears	1.00	≥ 17 teeth
	1.15	< 17 teeth
Chain sprockets	1.00	≥ 20 teeth
	1.25	< 20 teeth
	1.40	< 13 teeth
V Narrow V-belt pulleys	1.75	Influence of the tensile force
Flat belt pulleys	2.50	Influence of the tensile force
Toothed belt pulleys	2.50	Influence of the tensile force

The overhung loads exerted on the motor or gear shaft is then calculated as follows:

$$F_r = \frac{M \cdot 2000 \cdot f_z}{d_0} \text{ [N]}$$

F_r Resulting radial load [N]

M Torque on the shaft [Nm]

d_0 Mean diameter of the mounted transmission element in [mm]

f_z Transmission element factor

The basis for determining the permitted radial loads is the computation of the rated service life **LH10** of the bearings (according to **ISO281**). For special operating conditions, the permitted radial loads can be determined with regard to the modified service life L_{na} . The permitted radial loads **Fr2** for the output shafts of foot-mounted gear units with a solid shaft are listed in the selection tables. Contact our company in case of other versions.

The permitted radial loads given in the selection tables must be calculated using the following formula in the event of force application not in the center of the shaft end. The smaller of the two values F_{xL} (according to bearing service life) and F_{xW} (according to shaft strength) is the permitted value for the radial load at point x. Note that the calculations apply to **M2 max**.

$$F_{xL} = F_{r2} \cdot \frac{a}{b+x} \text{ [N]}$$

$$F_{xW} = F_{r2} \cdot \frac{c}{f+x} \text{ [N]}$$

Fr2 Permitted overhung load ($x = L/2$) for foot-mounted gear units according to the selection tables in [N]

x Distance from the shaft shoulder to the force application point in [mm]

a, b, f Gear unit constant for overhung load conversion [mm]

c Gear unit constant for overhung load conversion [Nmm]

Gear unit type	a [mm]	b [mm]	c [Nmm]	f [mm]	d [mm]	L [mm]

4.7 Selection tables comments

	Combination with the motor in the header row is possible
	Combination with the motor in the header row is not possible
*	Finite gear unit reduction ratio;
P_{1n}	Rated power driving motor [kW];
n_2	Output speed [r/min];
M_{2n}	Output torque [Nm];
M_{2max}	Max. permissible output torque [Nm]
F_{r2}	Permissible overhung load output side [N]
i	Gear unit ratio;
f_s	Service factor;
	Gear unit type;
	Motor type;
Page	Dimension sheet page no;

L	Total length of gearmotor;
L1	Total length of gearmotor including brake;
B	Length of motor;
B1	Length of brake motor;
AC	Diameter of motor;
AD	Center of motor shaft to top part of terminal box;
AD1	Center of brake motor shaft to top part of terminal box.

5. SELECTION EXAMPLE

5.1 Geared motor

Example: The input power of driver machine is 0.5KW, $n_1=1400\text{r/min}$, heavy load, continuous running for 24 hours, the ambient temperature is $+32^\circ\text{C}$, then choose the service factor, $f_s=1.7 \times 1.2=1.904$, $n_2=110\text{r/min}$, M4 mounted SO:

$$i = \frac{n_1}{n_2} = \frac{1400}{110} = 12.73$$

$$P_{1n} \geq P_1 \cdot f_s = 0.5 \times 1.904 = 0.952 \text{ [kW]}$$

Choose type:

TS58 - MY90S4 - 12.10 - M4

Count output torque:

$$M_2 = \frac{9550 \cdot P_1 \cdot \eta}{n_2} = \frac{9550 \times 0.5 \times 0.88}{110} = 38.2 \text{ [Nm]}$$

$$M_{2n} = 82 \geq M_2 \cdot f_s = 38.2 \times 1.904 = 72.7 \text{ [Nm]}$$

5.2 Gear units

Example: Required torque 300Nm on driven machine, continuous running for 8 hours, uniform load, the ambient temperature is 30°C , then choose the service factor $f_s=1.2 \times 1.1=1.32$, $n_1=900\text{r/min}$, $n_2=30\text{r/min}$.

$$M_{2n} \geq M_2 \cdot f_s = 300 \times 1.32 = 396 \text{ [Nm]}$$

$$i = \frac{n_1}{n_2} = \frac{900}{30} = 30$$

Choose type:

TS68 - 29.63

8. MOUNTING POSITIONS

8.1 Mounting position designation

Differentiates between six mounting positions M1 ... M6 for gear units. The following figure shows the spatial orientation of the gearmotor in mounting positions M1 ... M6.

TS..

8.2. Mounting positions for helical-worm gearmotors

TS38

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

Important: Please refer to the  information in the 'Geared Motors' catalog, Sec. (page 119)..

TS48-TS98

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

Mounting position	Gear unit size	Input speed [r/min]
M2*,M3*,M4*,M5*,M6*	78...98	>2500

Important: Please refer to the **i** information in the 'Geared Motors' catalog, Sec(page 119).

Increased churning losses may arise in some mounting positions. Contact us in case of the above-mentioned combinations.

TSF/TSAF/TSHF38

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

TSF/TSAF/TSHF/TSAZ/TSHZ48-98

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

Mounting position	Gear unit size	Input speed [r/min]
M2*, M4*, M5*, M6*	78...98	>2500

Increased churning losses may arise in some mounting positions. Contact us in case of the above-mentioned combinations.

TSA/TSH38

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

TSA/TSH48-98

Symbol	Meaning
	Breather valve
	Oil level plug
	Oil drain plug

Mounting position	Gear unit size	Input speed [r/min]
M2*, M4*, M5*, M6*	78...98	>2500

Increased churning losses may arise in some mounting positions. Contact us in case of the above-mentioned combinations.

The data refer to the radial force acting midway on the shaft end (with right-angle gear units on the A-side output). Worst case conditions have been assumed for the force application angle α and the direction of rotation.

1. only 50% of the F_{r2} value specified in the selection tables is permitted in mounting position M1 with wall attachment on the front face for **TS** gear units

8.3 Direction of rotation

If the drive has a backstop RS, it is also necessary to stipulate the direction of rotation of the drive. The following definition applies, looking onto the output shaft:

Clockwise(CW)=Rotating clockwise

Counterclockwise(CW)=Rotating clockwise

Figure :Direction of rotation of the output.

In right-angle gear units it is also necessary to stipulate whether the direction of rotation is given looking onto the A or B end.

8.4 Position of the output shaft and the output flange

Figure:Position of the output shaft and the output flange

In right-angle gear units, it is also necessary to stipulate the position of the output shaft and the output flange:

A or B or A+B

8.5 Position of the connection end in right-angle gear units

Figure: Position of the connection end

In shaft mounted right-angle gear unit with a shrink disk, it is also necessary to stipulate whether the **A** or **B** end is the connection end. In Figure 12, the **A** end is the connection end, the shrink disk is located opposite to the connection end.

8.6 Sample orders

TYPE (examples)	Mounting position	Shaft with	Flange with	Connection end	Position of shrink disk	Position of terminal box	Position	Direction of rotation of the output
TS78MY100L4	M6	A+B	-	-	-	90°	'N'	CW
TSA98MY100M6	M4	-	-	B	-	270°	'E'	-
TSH58MY90S4	M1	-	-	A	B	180°	'N'	-

9. INSTALLATION METHODS

9.1. Preparation before the installation:

- Check if the data on the nameplates of the gearmotor matches the voltage supply system.
- Check if the drive has not been damaged during transportation and storage.
- For standard gear unit, the ambient temperature must be in accordance with the corresponding lubricant table.
- The drive must not be assembled in conditions such as oil, gas, vapors, acids, radiation and so on.
- Output shaft and flange surfaces must thoroughly cleaned to ensure they are free of anti-corrosion agents, contamination or similar. Use a commercially available solvent. Do not let the solvent come into contact with the sealing lip of the oil seals, or will damage the material!
- The supporting structure must have the following characteristics: level, vibration damping and torsionally rigid.
- So as to prevent the tolerance of fit of gear units from damaging, the parts assembled on the gear units must be worked as specified tolerance according to **ISOH7**.

9.2. the installation of the gear units:

- Do not tighten the housing legs and mounting flanges against one another and ensure that you comply with the permitted radial load and axial load.
- Never drive belt pulleys, couplings, pinions, etc. onto the shaft end by hitting them with a hammer. This will damage the bearing, housing and the shaft.
- When installing the **IEC** couplings, remove the key from the motor shaft and replace it with the supplied key. Secure key and coupling half using grub screw and tighten to the motor shaft. Seal the contact surface between the adapter and motor using a suitable sealing compound.
- Prior to startup, check that if the oil level is as specified for the mounting position. if the oil checking and drain screw and the breather valves are free accessible.

10. LUBRICATION

10.1 Types of lubrication

						lubrication type
TS..	Standard 0 +40	VG680	Shell Omala 680	Mobilgear 636	BP Energol GR-XP 680	Mineral oil

	-40 0	VG 32		Mobil SHC 624		

10.2 Lubricant fill quantity

The specified fill quantities are recommended values. The precise values vary depending on the number of stages and gear ratio. When filling, it is essential to check the oil level plug since it indicates the precise oil capacity. The following tables show guide values for lubricant fill quantities in relation to the mounting position M1 ~ M6.

TS.. :

Gear units	Fill quantity in liters (L)					
	M1	M2	M3**	M4	M5	M6
TS38	0.25	0.40	0.50	0.55	0.40	0.40
TS48	0.35	0.80	0.70/0.90	1.00	0.80	0.80
TS58	0.50	1.20	1.00/1.20	1.45	1.30	1.30
TS68	1.00	2.0	2.2/3.1	3.1	2.6	2.6
TS78	1.90	4.2	3.7/5.4	5.9	4.4	4.4

** The large gear unit of multi-stage gear units must be filled with the larger oil volume.

11. MAINTENANCE

1). For gear units, first oil change should be after about 300 hours (run-in period). The right lotion is required to clean the gear units with care. Never mix the synthetic oil and mineral oil together.

2). Every 3000 working time, at least every 6 months, you have to check the oil and oil level, the seals visually for leakage. For IEC input gear units, the elastomer should be tested or replaced if necessary.

3). Depending on the operating conditions (see chart below), every 3 years at the latest for inspection is needed. Then change the mineral oil and replace the bearing grease.

4). Depending on the operating conditions, change the oil seals on output shaft.

5). Once the malfunctions appear, stop disassembling the parts, and firstly please contact the customer service (the information about specification, delivery date, series number, time used, name of machine, machine manufacturer, malfunction problems is required) , then take the reasonable measures.

12. STORAGE

- 1). Under roof, protected against rain and snow, no shock loads.
- 2). Underlay the block and other material between the ground and equipment.
- 3). The opened but not used gear units should be added with the anti-corrosive oil on its surface, and then return to the packing containers timely.
- 4). Two years or more given regular inspections. Check for cleanliness and mechanical damage as part of the inspection, Check corrosion protection.

13. NOTICE FOR ORDER

Please offer the following information when place the orders:

- 1). the model mark of the gear units(type, ratio, power and mounting position).
- 2). gear units are available with "blue/gray" painting optionally. Unless specified, it offers the blue painting as standard.
- 3). quantity ordered.
- 4). other special requirements.
- 5). company, contact and telephone.

14. MALFUNCTIONS

14.1 Gear unit malfunctions

Problem	Possible cause	Remedy
Unusual, regular running noise	A. Meshing/grinding noise: Bearing damage. B. Knocking noise: Irregularity in the gearing	A. Check the oil, change bearings B. Contact customer service
Unusual, irregular running noise	Foreign bodies in the oil	- Check the oil - Stop the drive, contact customer service
Oil leaking ¹⁾ - From the gear cover plate - From the motor flange - From the motor oil seal - From the gear unit flange - From the output end oil seal	A. Rubber seal on the gear cover plate leaking B. Seal defective C. Gear unit not vented	A. Tighten the bolts on the gear cover plate and observe the gear unit. Oil still leaking: Contact customer service B. Contact customer service C. Vent the gear unit (see "Mounting Positions")
Oil leaking from breaking valve	A. Too much oil B. Drive operated in incorrect mounting position C. Frequent cold starts (oil foams) and/or high oil level	A. Correct the oil level (see Sec. "Inspection and Maintenance") B. Mount the breather valve correctly (see Sec. "Mounting Positions") and correct the oil level (see "Lubricants")
Output shaft does not turn although the motor is running or the input shaft is rotated	Connection between shaft and hub in gear unit interrupted	Send in the gear unit/gearmotor for repair

1) Short-term oil/grease leakage at the oil seal is possible in the run-in phase (24 hours running time).

14.2 IEC couplings malfunctions

Problem	Possible cause	Remedy
Unusual, regular running noise	Meshing/grinding noise: Bearing damage	Contact our company customer service
Oil leaking	Seal defective	Contact our company customer service
Output shaft does not turn although the motor is running or the input shaft is rotated	Connection between shaft and hub in gear unit interrupted	Send the gear unit to our company for repair.
Change in running noise and / or vibrations occur	A. Annular gear wear, short-term torque transfer through metal contact B. Bolts to secure hub axially are loose.	A. Change the annular gear B. Tighten the bolts
Premature wear in annular gear	A. Contact with aggressive fluids / oil; ozone influence; too high ambient temperatures etc, which can cause a change in the physical properties of the annular gear. B. Impermissibly high ambient/contact temperature for the annular gear; maximum permitted temperature -20 °C to +80 °C. C. Overload	Contact our company customer service
